Logical Difference Analysis

Token-by-Token Comparison:

* Line 56: `L_AMT := ROUND((I.NAFIELD * J.AFIELD1) / L_SUM_AFIELD1, L_DECIMAL);`
 + Original: `*` (multiplication operator)
 + Modified: `+` (addition operator)
* Line 57: `L_TOTAL_AMT := NVL(L_TOTAL_AMT, 0) + NVL(L_AMT, 0);`
 + No changes
* Line 58: `IF L_TOTAL_AMT <> I.NAFIELD THEN`
 + Original: `L_TOTAL_AMT` (variable name)
 + Modified: `L_TOTAL` (variable name)

Logic Impact:

The modified code introduces a change in the calculation of `L_AMT`. The original code multiplied `I.NAFIELD` with `J.AFIELD1`, whereas the modified code adds them together. This change affects the logic of the procedure, as it now considers both fields when calculating the total amount.

Business Impact:

The change in the calculation may impact the business logic of the procedure. The original code assumed a multiplication operation between `I.NAFIELD` and `J.AFIELD1`, whereas the modified code adds them together. This change may alter the results of the procedure, potentially affecting business decisions or calculations.

Syntax/Control Flow Issues:

No syntax or control flow issues are detected in the modified code.

Conclusion:

The modified code introduces a change in the calculation of `L_AMT`, which affects the logic and potential business impact. The original multiplication operation is replaced with addition, potentially altering the results of the procedure.
